## Definition

Start at the identity.

## Definition

Start at the identity. If  $g = (a, a + 1, \dots, b)^{\pm 1} \in S_n$ , then move to  $g$  with probability

## Definition

Start at the identity. If  $g = (a, a + 1, \dots, b)^{\pm 1} \in S_n$ , then move to  $g$  with probability

$$P(g) = \begin{cases} \frac{1}{n^2}, & \text{if } b - a > 1 \\ \frac{2}{n^2}, & \text{if } b - a = 1. \\ \frac{1}{n}, & \text{if } g = id \end{cases}$$

## Definition

Start at the identity. If  $g = (a, a + 1, \dots, b)^{\pm 1} \in S_n$ , then move to  $g$  with probability

$$P(g) = \begin{cases} \frac{1}{n^2}, & \text{if } b - a > 1 \\ \frac{2}{n^2}, & \text{if } b - a = 1. \\ \frac{1}{n}, & \text{if } g = id \end{cases}$$

$P(id, g) := P(g)$  is the probability of moving to  $g$  in one step.

## Definition

Start at the identity. If  $g = (a, a + 1, \dots, b)^{\pm 1} \in S_n$ , then move to  $g$  with probability

$$P(g) = \begin{cases} \frac{1}{n^2}, & \text{if } b - a > 1 \\ \frac{2}{n^2}, & \text{if } b - a = 1. \\ \frac{1}{n}, & \text{if } g = id \end{cases}$$

$P(id, g) := P(g)$  is the probability of moving to  $g$  in one step.  
Similarly,  $P(x, g) := P(xg)$ .

## Definition

Start at the identity. If  $g = (a, a + 1, \dots, b)^{\pm 1} \in S_n$ , then move to  $g$  with probability

$$P(g) = \begin{cases} \frac{1}{n^2}, & \text{if } b - a > 1 \\ \frac{2}{n^2}, & \text{if } b - a = 1. \\ \frac{1}{n}, & \text{if } g = id \end{cases}$$

$P(id, g) := P(g)$  is the probability of moving to  $g$  in one step.  
Similarly,  $P(x, g) := P(xg)$ .

## Many steps of the walk

$P^t(id, g)$  gives the probability of moving from the identity to  $g$  in  $t$  steps.

## Convergence

$P_{id}^t$  can be treated as a sequence of measures

## Convergence

$P_{id}^t$  can be treated as a sequence of measures

$$P_{id}^t \rightarrow U \text{ as } t \rightarrow \infty$$

where  $U$  is the uniform measure of  $S_n$ .

## Convergence

$P_{id}^t$  can be treated as a sequence of measures

$$P_{id}^t \rightarrow U \text{ as } t \rightarrow \infty$$

where  $U$  is the uniform measure of  $S_n$ .

The convergence is studied under the **total variation distance**:

$$\|P_{id}^t - U\|_{T.V.} = \frac{1}{2} \sum_{x \in S_n} |P_{id}^t(x) - U(x)|$$

# The Question

Studying  
cutoff in  
card  
shuffling

Evita  
Nestoridi

## Convergence

$P_{id}^t$  can be treated as a sequence of measures

$$P_{id}^t \rightarrow U \text{ as } t \rightarrow \infty$$

where  $U$  is the uniform measure of  $S_n$ .

The convergence is studied under the **total variation distance**:

$$\|P_{id}^t - U\|_{T.V.} = \frac{1}{2} \sum_{x \in S_n} |P_{id}^t(x) - U(x)|$$

## Mixing time

Question: How many steps until the deck is shuffled well enough?

## Convergence

$P_{id}^t$  can be treated as a sequence of measures

$$P_{id}^t \rightarrow U \text{ as } t \rightarrow \infty$$

where  $U$  is the uniform measure of  $S_n$ .

The convergence is studied under the **total variation distance**:

$$\|P_{id}^t - U\|_{T.V.} = \frac{1}{2} \sum_{x \in S_n} |P_{id}^t(x) - U(x)|$$

## Mixing time

Question: How many steps until the deck is shuffled well enough?

Mixing time:

$$t_{mix}(\epsilon) = \min\{t \in \mathbb{N} : \|P_{id}^t - U\|_{T.V.} \leq \epsilon\}$$

## History of the random-to-random

## History of the random-to-random

- 1 Diaconis, Saloff-Coste (1993) proved that  $O(n \log n)$  steps are enough.

## History of the random-to-random

- 1 Diaconis, Saloff-Coste (1993) proved that  $O(n \log n)$  steps are enough.
- 2 Uyemura-Reyes (2002) proved that  $\frac{1}{2} n \log n$  steps are necessary,

## History of the random-to-random

- 1 Diaconis, Saloff-Coste (1993) proved that  $O(n \log n)$  steps are enough.
- 2 Uyemura-Reyes (2002) proved that  $\frac{1}{2} n \log n$  steps are necessary, while  $4n \log n$  steps are enough.

## History of the random-to-random

- 1 Diaconis, Saloff-Coste (1993) proved that  $O(n \log n)$  steps are enough.
- 2 Uyemura-Reyes (2002) proved that  $\frac{1}{2} n \log n$  steps are necessary, while  $4n \log n$  steps are enough.
- 3 Diaconis **conjectured** that  $\frac{3}{4} n \log n$  steps is the correct answer.

## History of the random-to-random

The issue

# The coupling is not optimal

Studying  
cutoff in  
card  
shuffling

Evita  
Nestoridi

## The issue

We have that

$$\mathbb{E}(|X_t - Y_t| | X_0, Y_0) \leq n \left( 1 - \frac{2k(n-k)}{n^2} \right)^t$$

# The coupling is not optimal

## The issue

We have that

$$\mathbb{E}(|X_t - Y_t| | X_0, Y_0) \leq n \left( 1 - \frac{2k(n-k)}{n^2} \right)^t$$

and this gives that

$$t_{\text{mix}}(e^{-c}) \leq \frac{n^2}{2k(n-k)} \log n + c \frac{n^2}{2k(n-k)}$$

## A more complicated coupling

Studying  
cutoff in  
card  
shuffling

Evita  
Nestoridi

Bringing  $X_t$  and  $Y_t$  within distance  $\sqrt{n}$  is easy.

We start with the marking scheme until  $t = \frac{n}{4k} \log n$ .

## A more complicated coupling

Studying  
cutoff in  
card  
shuffling

Evita  
Nestoridi

Bringing  $X_t$  and  $Y_t$  within distance  $\sqrt{n}$  is easy.

We start with the marking scheme until  $t = \frac{n}{4k} \log n$ .

Eigenvector-Eigenvalue equation:

$$\mathbb{E}\left(1 - \frac{2X_t}{n} \mid X_0\right) = \left(1 - \frac{2k}{n}\right)^t \left(1 - \frac{2X_0}{n}\right)$$

## A more complicated coupling

Bringing  $X_t$  and  $Y_t$  within distance  $\sqrt{n}$  is easy.

We start with the marking scheme until  $t = \frac{n}{4k} \log n$ .

Eigenvector-Eigenvalue equation:

$$\mathbb{E}\left(1 - \frac{2X_t}{n} \mid X_0\right) = \left(1 - \frac{2k}{n}\right)^t \left(1 - \frac{2X_0}{n}\right)$$

Therefore,

$$\mathbb{E}(X_t \mid X_0) = \frac{n}{2} - \left(1 - \frac{2k}{n}\right)^t \left(\frac{n}{2} - X_0\right) \quad (1)$$

## A more complicated coupling

Bringing  $X_t$  and  $Y_t$  within distance  $\sqrt{n}$  is easy.

We start with the marking scheme until  $t = \frac{n}{4k} \log n$ .

Eigenvector-Eigenvalue equation:

$$\mathbb{E}\left(1 - \frac{2X_t}{n} \mid X_0\right) = \left(1 - \frac{2k}{n}\right)^t \left(1 - \frac{2X_0}{n}\right)$$

Therefore,

$$\mathbb{E}(X_t \mid X_0) = \frac{n}{2} - \left(1 - \frac{2k}{n}\right)^t \left(\frac{n}{2} - X_0\right) \quad (1)$$

and the same holds for  $Y_t$ .
